

CORROSION MAPPING

Damage inflicted by corrosion and erosion can prove costly. To reduce these risks and ease operational maintenance, recognizing corrosion damage early is a top priority.

Corrosion Mapping is a unique, non-intrusive technique, which maps material flaws and thicknesses.

The Automated Magnetic Crawler inspects large areas to detect:

- Large and small-diameter pitting
- Corrosion
- Erosion in piping
- Pressure vessels
- Tanks
- Tank Floors

This process accurately pinpoints the amount and location of corrosion.
